HTTP request methods

HTTP defines a set of **request methods** to indicate the desired action to be performed for a given resource. Although they can also be nouns, these request methods are sometimes referred to as *HTTP verbs*. Each of them implements a different semantic, but some common features are shared by a group of them: e.g. a request method can be safe, idempotent, or cacheable.

GET

The `GET` method requests a representation of the specified resource. Requests using `GET` should only retrieve data.

HEAD

The `HEAD` method asks for a response identical to a `GET` request but without the response body.

POST

The `POST` method submits an entity to the specified resource, often causing a change in state or side effects on the server.

PUT

The `PUT` method replaces all current representations of the target resource with the request payload.

DELETE

The `DELETE` method deletes the specified resource.

CONNECT

The `CONNECT` method establishes a tunnel to the server identified by the target resource.

OPTIONS

The `OPTIONS` method describes the communication options for the target resource.

TRACE

The `TRACE` method performs a message loop-back test along the path to the target resource.

PATCH

The `PATCH` method applies partial modifications to a resource.
